

# SAFETY INSTRUCTIONS

## FortNovo Socket safes (all models)

The socket safe is designed exclusively for the safe storage of small valuables such as cash, jewellery, keys or USB sticks.

It is a dummy socket without a power connection - the safe must not be used as a real socket or connected to a power source.

Ensure that the safe is professionally installed in a suitable wall. Improper installation can impair stability and camouflage.

Use the supplied drilling template, screws and instructions to securely fasten the safe.

The socket safe must not be installed in load-bearing or fire-resistant walls if this is prohibited by building regulations.

Avoid conspicuous behaviour or frequent use of the safe in the presence of strangers in order to maintain inconspicuousness.

The socket safe is not a substitute for a high-security certified safe. It serves as an additional security feature for inconspicuous storage.
